# FROM THE DOCTOR

Dr. Bentow utilizes an evidence based approach to dermatology and his patients benefit from the most current recommendations and latest treatments as well as his care and professional manner.

His focus is on clinical skin care and his interests include diagnosis and treatment of inflammatory, infectious and neoplastic skin disorders. He treats patients with alopecia, acne, rosacea, psoriasis, eczema, autoimmune skin diseases as well as acute and chronic causes of rashes and itch. He is also interested in surgical treatment of skin cancer and benign skin lesions.

#### SERVICES INCLUDE:

• Skin Cancer Screenings – Extensive, dermatologist performed, examinations of your skin to identify and treat cancers and other dermatological conditions. Skin cancers found and removed early are almost always curable. Dr. Bentow knows that though there are many effective treatment options, early identification is key.

#### SURGICAL EXPERTISE:

- Cryosurgery Cryosurgery is a simple, non-invasive procedure in which liquid nitrogen is used to freeze and destroy growths on the surface of the skin. It's an effective treatment for precancerous skin lesions (actinic keratoses) as well as a range of skin conditions, including warts, skin tags, and moles.
- **Curettage** Skin Cancer is removed by scraping the area with a sharp looped-edged instrument called a curette. The cancerous area is then treated with an electrocautery needle to destroy any remaining cancer cells.
- <u>Surgical Excisions</u> Any Cancerous growths can be removed through excisions in order to ensure complete removal.
